

MULTI-DIRECTIONAL APPLICATOR

ABSTRACT

A multi-directional applicator comprising an elongated tube with a sealed end and an open end with an applicator tip affixed to the open end of the elongated tube and multiple score lines formed along the length of the elongated tube. The elongated tube is affixed within an elongated tubular housing with two ends that are sealed near the two ends of the elongated tube and encloses a fluid. When the elongated tube is fractured at one of its score line by bending the elongated tubular housing and the elongated tube the fluid within the elongated tubular housing may be squeezed out of the elongated tubular housing through the fractured opening into the elongated tube and into the applicator tip.
